About the Office for National Statistics

The Office for National Statistics (ONS) is the government agency responsible for compiling, analysing and disseminating many of the United Kingdom's economic, social and demographic statistics, including the retail prices index, trade figures and labour market data, as well as the periodic census of the population and health statistics. The Director of ONS is also the National Statistician and the Registrar General for England and Wales, and the agency administers the registration of births, marriages and deaths there.

A National Statistics publication

National Statistics are produced to high professional standards set out in the National Statistics Code of Practice. They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference.

We would like to thank everybody who contributed to the Survey and the production of this report. We were supported by our specialist colleagues in ONS who were responsible for sampling, fieldwork, coding and editing.

Our thanks also go to colleagues who supported us with administrative duties and during publication. Particular thanks are due to the interviewers who worked on the 2002 survey, and to all those members of the public who gave their time and co-operation.

Chapter 1 Introduction

Introduction

This report presents findings from the sport and leisure module of the 2002/2003 General Household Survey (GHS). It asked people aged 16 and over about their participation in a wide range of sport and leisure activities. It also included, for the first time in 2002, questions about volunteering in sports and the arts. The module was commissioned by the Department for Culture, Media and Sport (DCMS), Sport England, UK Sport and Arts Council England to provide a measure of the effectiveness of campaigns encouraging people to take more exercise, and to help monitor the growth or decline of particular sports and leisure activities.

Taking part in the arts, sport and recreation are perceived to have beneficial social, economic and health impacts. In December 2002, the Prime Minister's Strategy Unit and DCMS jointly published a report called *Game Plan*¹, which included a target for increasing the proportion of the population in England that were reasonably active² from around 30% in 1998 to 70% in 2020.

In April 2004, Sport England published the *Framework for Sport in England*³, which set out the agenda to work towards achieving the main aims of *Game Plan*. It has a target of 1% growth per year in regular sports participation for people aged 16 or over (with a view to achieving at least 50% participation in 2020). It also noted that sport relies heavily on volunteers.

As stated in its *Corporate Plan 2003-2006*, Arts Council England⁴ aims to increase the number of people who engage in the arts. It is trying to ensure that there is a growth in participation amongst Black and minority ethnic groups, disabled people and socially excluded groups.

A consistent set of questions about participation in sport and leisure activities has been asked on the General Household Survey at three-year intervals since 1987⁵. Questions on sport and leisure activities had previously been included on the GHS at regular intervals since 1973. In 1987

a new set of questions was introduced in order to improve the accuracy of the information collected. Respondents were prompted with a list of sports or activities on a showcard and asked about participation both in the previous four weeks and in the 12 months before interview. Prior to this the survey had used an 'open-ended' question asking respondents to recall all their leisure activities in the four weeks before interview. The change to the questionnaire in 1987 caused a discontinuity in the measurement of trends.

In addition to the sport and leisure module, the GHS includes other relevant information that has been drawn on in this report, such as National Statistics Socio-economic Classification (NS-SEC), economic activity status and attendance at leisure and recreational classes.

The 2002 GHS is weighted using a two-step approach. In the first step the data are weighted to compensate for non-response in the sample based on known under-coverage in the Census-linked study of non-response⁶ (Foster, 1994). The second step weights the sample distribution so that it matches known population distributions in terms of region, age group, and sex (as used in the Labour Force Survey). For further information on the weighting procedure please see Appendix D of the main Living in Britain report⁷.

Chapter 2 Summary of main findings

Since 1987 the General Household Survey (GHS) has periodically included a set of questions about adult participation in sport and leisure activities. These questions cover a wide range of sports, games and physical activities¹, and selected leisure activities. In 2002 the GHS collected information about sports and leisure participation from approximately 14,800 people aged 16 and over, living in private households. This chapter presents a summary of the main findings.

Changes and additions to the wording of certain questions mean that the time period for which information is available varies. The introduction of weighting for non-response² also had a small effect on some of the trend data. Changes to the classification of socio-economic status have also affected the presentation of time-series data.

Participation in sports, games and physical activities

- In 2002 three quarters of adults (75%) had taken part in a sport, game or physical activity in the twelve months before interview and 59% of adults had done so in the previous four weeks. When people who had only been walking were excluded from these overall participation rates, they decreased to 66% and 43% respectively.
- Based on annual participation (participation in the last twelve months), walking (46%) was the most popular sports activity followed by swimming (35%), keep fit/ yoga – including aerobics and dance exercise (22%), cycling (19%) and cue sports³ (17%).
- Men were more likely than women to have participated in at least one sport, game or physical activity, including or excluding walking, in either the four weeks or twelve months before interview.
- Overall sports participation (including walking) in the last four weeks increased from 61% of adults in 1987 to 65% in 1990 and remained at about this level through to 1996. Participation then declined to 59% in 2002. The trend for twelve-month participation rates was similar.
- In general, participation in a sport, game or physical activity decreased with age. For example, among those aged 16 to 19, 72% had participated in an activity (excluding walking) in the four-week reference period compared with 14% of those aged 70 and over.
- Among adults in Great Britain, 62% of people living in Scotland had participated in at least one sports activity (including walking), in the previous four weeks, compared with 58% of adults in England and 57% of adults in Wales. The higher participation rate in Scotland was mainly due to the higher proportions who had been walking in the previous four weeks (43% compared with 34% in England and 35% in Wales).
- Half of adults living in the South West reported they had participated in at least one sports activity (excluding walking) in the four weeks before interview, compared with 37% to 46% of adults living in other regions in England.
- 44% of men and 31% of women, who participated in at least one activity (excluding walking and darts) in the four weeks before interview, had belonged to a club for the activity during that period.
- Overall, men were more likely than women to have participated in an organised competition in the twelve months before interview; four in ten men (40%) had done so compared with one in seven (14%) women.
- Women sports participants were more likely than their male counterparts to have received tuition to improve their performance in a sport, game or physical activity in the twelve months before interview (45% compared with 31%).
- Among adults who said they would like to do a sport that they were not currently doing, 16% had not participated in a sport, game or physical activity in the twelve months before interview.

Participation in leisure activities

In 2002 data were collected about adults' participation in selected leisure activities. It was reported in the four weeks before interview that:

- 99% watched TV;
- 88% listened to the radio;
- 83% listened to records/tapes;
- 65% read books;
- 11% sang or played a musical instrument either to an audience, or to rehearse for an event or for their own pleasure;
- 11% danced (excluding fitness classes and aerobics);
- 9% painted or did drawing, printmaking or sculpture;
- 4% wrote stories, plays or poetry;
- 3% helped with the running of an arts/cultural event or organisation on a voluntary basis (without pay except for expenses); and
- 2% performed in a play, drama or rehearsed for a performance.

Women were more likely than men to have read books (72% compared with 58%). In general, it was found that the proportion of adults who listened to the radio or records/tapes decreased with age.

In terms of adult participation in selected leisure activities over time:

- in 2002 the majority of respondents had watched TV (99%) and a high proportion had listened to the radio (88%), which remains unchanged since 1996;
- the proportion of adults who said they had listened to records or tapes in the four weeks before interview has increased steadily over the last 25 years from 62% in 1977 to 83% in 2002; and
- between 1996 and 2002 there has been no change in the proportion of adults who read books (65%).

All adults were also asked whether they had participated in specialised leisure activities (the arts)⁴ in the four weeks before interview. In general, participation in the arts decreased with age but the association was less pronounced than it was for sports participation.

- Men and women in the youngest age group (16 to 19) were the most likely to have performed in a play, done painting, writing or to have helped with the running of an arts/cultural event or organisation on a voluntary basis.
- Adults whose household reference person (HRP) was in the large employers and higher managerial group were more likely than those whose HRP was in the routine group to have participated in the majority of the arts.
- Among adults who reported they were suffering from a limiting longstanding illness or disability⁵, 23% said they had participated in the arts compared with 28% of adults who had not reported a limiting longstanding illness. However, there were no significant differences between participation levels in painting and writing stories/plays by whether people had a limiting longstanding illness or not.
- 7% of adults aged 16 to 69 had attended a leisure or recreation class⁶ in the four weeks before interview. Women were over twice as likely as men to have reported they attended a leisure or recreation class (10% compared with 4%).

Chapter 4

Sports and arts participation

In 2002 in the four weeks before interview (excluding walking):

- 28% of adults had participated in sports only;
- 15% of adults had participated in sports and the arts;
- 12% of adults had participated in the arts only; and
- the remainder (45%) had not participated in either sports or the arts.

Among all adults, 4% said they had volunteered in sport and 3% said they had volunteered in the arts in the four weeks before interview.

Chapter 5

Notes and references

- 1 All references to 'sports' include sports, games and physical activities unless otherwise stated.
- 2 For more information, see Rickards L et al. *Living in Britain: Results from the 2002 General Household Survey: Appendix D*. The Stationery Office (London 2004), also available on the web: www.statistics.gov.uk/lib2002.
- 3 Cue sports refer to snooker, pool and billiards.

- 4 Specialised leisure activities (the arts) refer to singing or playing an instrument, dancing, painting, writing stories or poetry, and performing in a play.
- 5 Respondents are asked on the GHS whether they have a longstanding illness, disability or infirmity. Those who report a longstanding illness are then asked if this limits their activities in any way. It is left to the respondent to define what is meant by longstanding illness, disability or infirmity. For more details see Rickards L et al. *Living in Britain: Results from the 2002 General Household Survey: Chapter 7: General health and use of health services*. The Stationery Office (London 2004), also available on the web: www.statistics.gov.uk/lib2002.
- 6 'Leisure and recreation classes' includes any course or class which does not lead to an examination or qualification i.e. they are courses which are not designed to further people's career or job prospects. Interviewers were instructed that classes must be regular and have a teacher, instructor or supervisor.

Chapter 3 Participation in sports, games and physical activities

The General Household Survey (GHS) has asked a series of questions about sport¹ and leisure activities at regular intervals since 1987. Questions about sport and leisure were previously asked in 1996 but in 2002 several changes were made to the section. Appendix B provides details about these changes and the methodology.

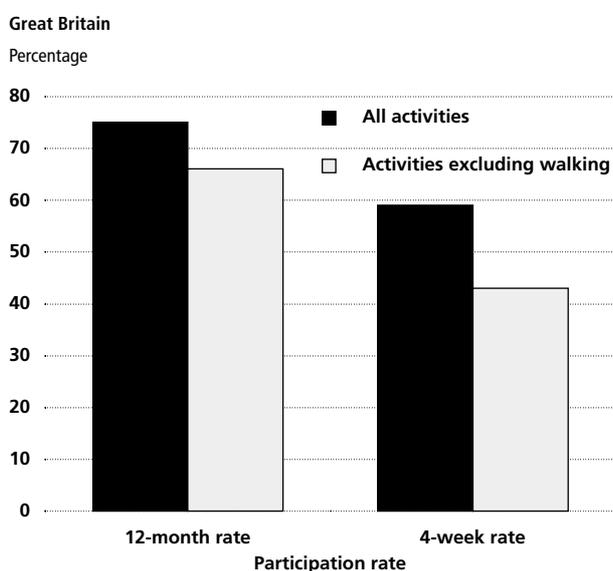

Information about a wide range of sports, games and physical activities was collected. Walking was included only if people went for a walk of two miles or more for recreational purposes. However, cycling was included irrespective of purpose.

Overall participation

In 2002 three quarters of adults (75%) had taken part in a sport, game or physical activity during the twelve months before interview and 59% of adults had in the four weeks before interview. Walking made a major contribution to these proportions. Excluding respondents whose only activity had been walking reduced these overall participation figures to 66% of adults in the last twelve months and 43% of adults in the last four weeks.

Figure A

Figure A Twelve-month and four-week participation rates for sports, games and physical activities: 2002

Thirty-one per cent of adults had participated in any activity (excluding walking) four or more times in four weeks (approximately once a week) and 15% had done so twelve or more times in four weeks (approximately three times a week).

Participation in specific activities

The five most popular sports were:

- walking (46% of adults had participated in the last 12 months and 35% in the last four weeks);
- swimming (35% of adults had participated in the last 12 months and 14% in the last four weeks);
- keep fit/yoga – including aerobics and dance exercise (22% of adults had participated in the last 12 months and 12% in the last four weeks);
- cycling (19% of adults had participated in the last 12 months and 9% in the last four weeks); and
- cue sports² (17% of adults had participated in the last 12 months and 9% in the last four weeks).

Compared with the other activities, keep fit/yoga was the most likely to have been done regularly. Eight per cent of adults said they had participated in keep fit/yoga four or more times in four weeks (approximately once a week) and 3% said they had participated in it twelve or more times in four weeks (approximately three times a week). Swimming was the next most frequently undertaken activity. Seven per cent of adults had been swimming four or more times in the four weeks before interview and 2% had been swimming twelve or more times in the four weeks before interview.

Tables 1-2

Participation rates were different for men and women. Men were more likely than women to have participated in at least one activity, including or excluding walking, in both the four-week and twelve-month reference periods. Men also had higher participation rates than women in each activity with the exception of indoor swimming, keep fit/yoga, horse riding, ice skating and netball.

In the four weeks before interview:

- nearly two thirds of men (65%) compared with just over half of women (53%) had participated in at least one activity;
- walking was the most popular activity for both men and women, followed by cue sports for men and keep fit/yoga for women; **Table 3, Figure B**
- 51% men and 36% of women had taken part in at least one activity other than walking;
- the biggest differences between men’s and women’s participation rates were found for:
 - Cue sports – 15% of men compared with 4% of women;
 - Soccer – 10% of men compared with less than 0.5% of women;
 - Keep fit/yoga – 7% of men compared with 16% of women; and
 - Golf – 9% of men compared with 1% of women.

Table 3, Figure C

Participation rates by age and sex

The proportion of adults who had taken part in at least one sport or physical activity in the four weeks before interview generally decreased with age. This association with age was more pronounced when walking was excluded from the overall measure. In 2002:

- 77% of 16 to 19 year olds had taken part in at least one physical activity (including walking) in the previous four weeks compared with 30% of people aged 70 and over;
- participation rates which excluded walking ranged from 72% of 16 to 19 year olds to 14% of people aged 70 and over.

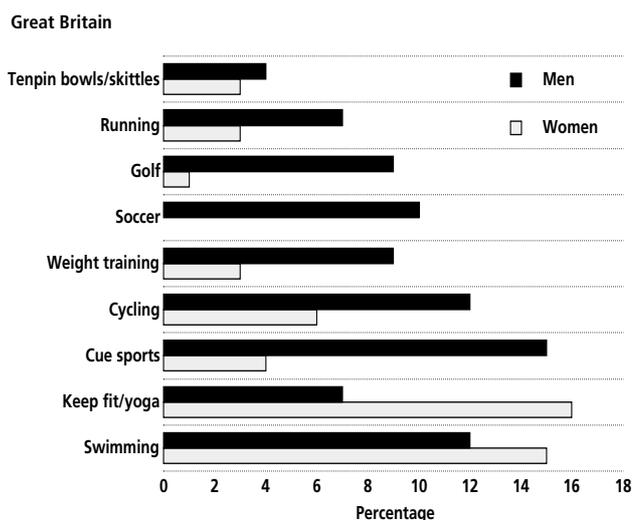

Walking was the most popular activity among each age group. Participation rates in walking increased from 29% of those aged 16 to 19 to 40% of those aged 45 to 59, after which they declined.

Participation in many activities was very strongly related to age. For example, activities such as soccer, cue sports, running and cycling were generally more popular with the younger age groups and the rates of participation for each of these activities decreased with age. However,

Figure B ‘Top ten’ sports, games and physical activities for men and women: rank order for participation in the four weeks before interview: Great Britain 2002

Men	%	Women	%
Walking	36	Walking	34
Snooker/pool/billiards	15	Keep fit/yoga	16
Cycling	12	Swimming	15
Swimming	12	Cycling	6
Soccer	10	Snooker/pool/billiards	4
Golf	9	Weight training	3
Weight training	9	Running	3
Keep fit/yoga	7	Tenpin bowling	3
Running	7	Horse riding	2
Tenpin bowling	4	Tennis	2

Figure C Proportion of men and women who participated in individual activities in the four weeks before interview: 2002

participation in golf maintained a fairly similar level up to age 69 and the median age of participants was 42. Participation rates in swimming and keep fit/yoga remained at similar levels between the ages of 16 and 44 after which they fell. Conversely, participants in bowls peaked among 60 to 69 year olds and the median age of participants was 66.

Table 4

The overall decrease in participation with age was similar for both men and women, although in each age group participation levels were lower for women than men. The gap between men’s and women’s participation rates (excluding walking) increased between the age groups 16 to 19 and 20 to 29 but then decreased in the older age groups.

Table 5, Figure D

Figure D Sports, games and physical activities: participation in at least one physical activity (excluding walking) in the four weeks before interview by sex and age: 2002

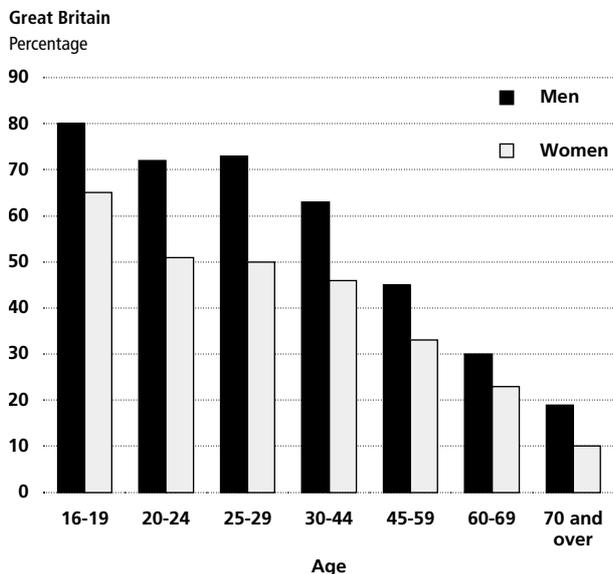

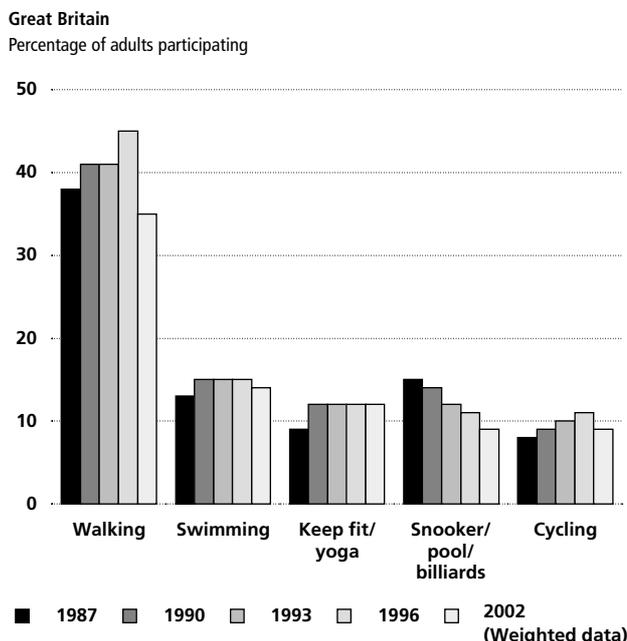

Figure E Trends in four-week participation rates for selected activities: 1987, 1990, 1993, 1996 and 2002

Trends in sports participation

Overall participation in at least one sport (including walking) in the four weeks before interview, increased from 61% of adults in 1987 to 65% in 1990 and remained at about this level through to 1996. Participation then declined to 59% in 2002. The pattern for participation in the twelve-month reference period was similar.

- The trends for participation in all sports (excluding walking) have shown less fluctuation over time but there was still a significant decrease in the percentage participating in the last four weeks, from 46% of adults in 1996 to 43% in 2002.
- The decrease in overall participation (including walking) was mainly attributable to a decrease in the percentages who had walked in the last four weeks³, from 45% of adults in 1996 to 35% of adults in 2002.
- Participation rates in cue sports and cycling in the four weeks before interview both decreased from 11% in 1996 to 9% in 2002.
- Participation rates in swimming also showed a small but significant decrease between 1996 and 2002.
- Between 1996 and 2002, four-week participation rates in other activities showed little change. **Table 6, Figure E**

Among both men and women, overall sports participation has decreased since 1996. In 1996, 71% of men had participated in at least one activity, including walking, in the four weeks before interview, compared with 65% in 2002. Similarly for women, the four-week participation rate, including walking, fell from 58% in 1996 to 53% in 2002. The overall participation rates which exclude walking show similar but smaller downward trends, indicating that the overall decline in sports participation is partly accounted for by a decline in walking among both sexes.

In general there were few differences between men and women’s participation rates over time in specific activities, with two exceptions:

- among men there has been a significant decrease since 1996 in the proportions participating in cue sports from 20% in 1996 to 15% in 2002, whereas the proportions among women have remained relatively unchanged; and
- four-week participation rates in keep fit/yoga have remained fairly stable among women since 1990 (between 16% and 17%) but there has been an increase in participation among men from 5% in 1987 to 7% in 1996 and it has remained at this level since. **Table 7**

By age group, among 16 to 69 year olds, the proportion who had taken part in at least one activity (including walking) decreased between 1996 and 2002. This pattern was also evident among participation rates which excluded walking but was not significant for every age band. Among those aged 70 and over there was no significant change in participation rates between 1996 and 2002. **Table 8**

Participation rates by socio-economic classification

Based on the National Statistics Socio-economic Classification (NS-SEC)⁴, Table 9 shows participation rates by NS-SEC. There was a clear association between socio-economic status and participation rates in sports, games and physical activities in the four-week reference period, for example:

- among households headed by someone in the large employers and higher managerial group 59% of adults took part in at least one activity (excluding walking) in the four-week reference period compared with 30% among those headed by someone in the routine group;
- walking was the most popular activity among all socio-economic groups, but there were still large differences between the participation rates of adults within each group. Respondents whose household reference person (HRP) was in the large employers and higher managerial group were nearly twice as likely as those whose HRP was in the routine group to go for a walk of two miles or more in the four weeks before interview (46% compared with 25%);
- five times as many adults whose HRP was in the large employers and higher managerial group participated in keep-fit/yoga (20%) compared with those whose HRP was in the never worked and long-term unemployed group (4%); and
- among adults in households headed by people in the routine and never worked/long-term unemployed groups, no activity had a participation rate of more than 8% apart from walking. **Table 9**

Age-standardisation

As mentioned previously, there was a strong association between physical activity and age. Therefore it is important, when investigating the possible relationship between

physical activity and other characteristics that are strongly associated with age, to ensure that any observed differences cannot be attributed to differences in the age distribution alone. Tables 10, 11, 12 and 15 show age-standardised ratios⁵.

The standardised ratios in Table 10 show a similar pattern for men and women. Men and women in households with a HRP in the large employers and higher managerial group, or the higher professional group or the lower managerial and professional group were more likely than we would have expected on the basis of the age distributions alone to have participated in sports. The reverse was true for men and women in households headed by someone in the semi-routine group or the routine group. For the intermediate and small employers groups the participation rates are largely unaffected by standardisation. **Table 10**

The standardised ratios show that after accounting for age women in work are more likely than expected to have participated in at least one sports activity. There was no clear pattern for men in work.

Men and women who were economically inactive had lower participation rates than those who were in work or unemployed. For example, 40% of economically inactive women had participated in at least one sports activity in the four-week reference period compared with 64% of women in full-time work (the equivalent proportions for men were 47% and 72%). Although the economically inactive group had an older age structure than the other groups, the age-standardised ratios indicate that these differences may not be solely attributed to age.

Unemployed men were more likely than unemployed women to have participated in at least one sports activity in the four weeks before interview (69% compared with 64% respectively). **Table 11**

Age-standardised ratios show that both men and women in households comprising two adults only were more likely than expected, based on the age composition of these groups, to have participated in at least one sports activity (ratios of 105 for men and 107 for women respectively). For men and women in households where the youngest child was aged under five, the reverse was true (ratios of 90 for men and 83 for women). **Table 12**

Participation by region

There were some geographical variations in participation rates during the four weeks before interview. In 2002, among adults living in Great Britain, 59% had taken part in at least one activity (including walking). Scotland had the highest participation rate at 62% compared with 58% in England and 57% in Wales. The higher participation rate in Scotland was mainly due to the higher proportions who had been walking in the previous four weeks (43% compared with 34% in England and 35% in Wales).

In England, adults living in the South West were more likely than those in other regions to have participated in at least one activity excluding walking (50% compared with 37% to 46% for other regions in England). Respondents in the South West also had the highest proportions for walking (42% compared with 28% to 37% in other regions in England) and for swimming (18% compared with 11% to 15% in other regions in England).

Table 13

Participation by health status

As might be expected, people who reported that they had a limiting longstanding illness or disability⁶ were less likely to have participated in physical activities. For example, 40% of those who had a limiting longstanding illness had participated in at least one activity (including walking) in the four-week reference period, compared with 65% of adults without a limiting longstanding illness. In 2002:

- a quarter of adults with a limiting longstanding illness had gone for a walk of two miles or more in the four weeks before interview, which was by far the most popular activity among this group; and
- the other most popular activities, among adults with a limiting longstanding illness, all had participation rates of less than 10% (swimming 9%, keep fit/yoga 7%, cue sports 5% and cycling 5%).

Previous analyses of GHS data have shown that the likelihood of reporting a limiting longstanding illness increases with age. Therefore differences in participation rates between people who reported that they had a limiting longstanding illness or disability and people who did not may in part reflect the different age profile of the two groups.

Table 14

Participation by ethnicity

Pakistani/ Bangladeshi, Indian, Black Caribbean and Black African people were less likely than expected, after controlling for age, to have participated in at least one sports activity excluding walking (ratios of 38, 57, 62 and 64). It was particularly striking for Pakistani/Bangladeshi people as this group has a much younger age profile than many of the other ethnic groups. There was a similar picture for participation in at least one activity including walking. In contrast, White British people were more likely than expected on the basis of the age distribution to have participated in at least one sports activity (ratio of 104 excluding walking and 103 including walking).

Table 15

Use of facilities

Those who had participated in any sport (except walking and darts) in the four weeks before interview were asked what type of facility they used. Table 16 shows the percentages using different facilities. It should be noted that some variation in the type of facility used will reflect differences in sports participation. In 2002:

- nearly a quarter of adults (23%) had used an indoor facility which was mainly used for sport (e.g. a sports centre or indoor swimming pool) and about one in ten (11%) had used an outdoor facility which was mainly used for sport (e.g. playing field or outdoor swimming pool);
- sporting activities also took place in indoor facilities not mainly used for sport such as community facilities, like village halls (11%) and at home⁷ (4%);
- 5% of people who had used a facility mainly designed for sport or an indoor communal facility said the place they used belonged to a school, college or university⁸ (table not shown).

The type of facility used varied between men and women:

- men were nearly four times more likely than women to have used an outdoor sports facility (19% compared with 5%);
- men were also over twice as likely as women to have participated in an activity in an outdoor natural setting (22% compared with 10%);

- there was a small but statistically significant difference between the proportion of men and women who used indoor sports facilities (25% of men and 22% of women).

Table 16

Table 17 compares the use of different types of sports facility in different Government Office Regions. The only significant regional difference was that people living in Scotland were more likely than those living in England or Wales, to use an indoor facility mainly used for sport (27% compared with 23% and 20%) and an outdoor facility mainly used for sport (14% compared with 11% and 10%).

Table 17

Club membership, competition and tuition

People who had participated in at least one activity (excluding walking and darts) during the four weeks before interview were asked about club membership, participation in organised competitions and tuition for each activity undertaken. In general, activities with a high club membership also had a higher than average proportion of participants who took part in an organised competition in that activity. For example:

- bowls, golf, tennis, soccer and fishing were all activities with both a comparatively high proportion of club members and of competitive participation. For example, just over three quarters (76%) of bowls players, nearly half (49%) of golfers and a third (33%) of soccer players had belonged to a club in the four weeks before interview, while 63%, 42% and 46% respectively had also participated in an organised competition for that sport in the 12 months before interview;
- club membership and competitive participation was lowest among cyclists (3% and 2%) and tenpin bowlers/skittles players (6% and 8%);
- participants in keep fit/yoga, horse riding, weight training, weight lifting and golf were the most likely to have received tuition in the twelve months before interview (51%, 39%, 31%, 28% and 26% respectively).

Table 18

Club membership, participation in organised competition and tuition varied according to the age, sex and socio-economic classification of participants. Some of this variation reflects the different types of sports in which men and women of different ages participated.

- 44% of men and 31% of women, who participated in at least one activity (excluding walking and darts) in the four weeks before interview, had belonged to a club for the activity during that period.
- In general, club membership among women participants tended to increase with age; 23% of women aged 16 to 19 were members of a club compared with 46% of those aged 70 or over. Among men, club membership was highest among the two oldest age groups reflecting the high proportion of bowls players who belonged to clubs.
- Overall, men were more likely than women to have participated in an organised competition in the twelve months before interview, four in ten men (40%) had done so compared with one in seven women (14%).
- Men aged 16 to 19 who participated in a sport were the most likely to take part in an organised competition and men aged 45 to 59 were the least likely (51% compared with 34%).
- Among women sports players the youngest group was also the most likely to have participated competitively (31%) but this proportion was also relatively high in the two oldest age groups (18% and 20%). Relatively few older women participated in any sport. The survey data suggest that older women who do participate include a disproportionate number of 'serious' sports enthusiasts, hence the high proportion taking part competitively.
- Women sports participants were more likely than their male counterparts to have received tuition to improve their performance in the twelve months before interview (45% compared with 31%). This variation is at least partly attributable to the high proportion of women participating in activities such as keep fit/yoga or horse riding, which generally involves attending a class.
- The likelihood of having received tuition in a sport, game or physical activity tended to decrease with age among both men and women.
- Between 1996 and 2002, among those who participated in any activity (excluding walking and darts), club membership, competitive participation and tuition, increased significantly among men and women. For example in 1996, 32% of men who had played sports had participated competitively in the twelve months before interview, compared with 40% in 2002. In 1996,

27% of women sports participants had received tuition in the twelve months before interview, whereas the corresponding proportion in 2002 was 45%. **Table 19**

Sports participants living in households headed by someone in the large employers and higher managerial group were more likely than those in the routine or never worked and long-term unemployed groups to have been members of a sports club, participated competitively or received tuition in a sport.

- 46% of sports participants living in households whose HRP was in the large employers and higher managerial group belonged to a club compared with 31% of those whose HRP was in the routine group and 19% of those whose HRP was in the never worked and long-term unemployed group. **Table 20**

Sports people would like to participate in

For the first time in 2002 on the GHS, respondents were asked whether there were any sports or recreational activities that they did not do but would like to do.

- 37% of respondents said they would like to do a sport or recreational activity, which they were not doing at present and nearly all (99%) of those people, said they wanted to do some kind of sport as opposed to a recreational activity (table not shown).
- Among adults who wanted to do a sport, 16% had not done a physical activity in the 12 months before interview. This proportion was higher among women than men (19% compared with 13% - tables not shown).

Among those who said they were interested in doing a sport they did not currently do, the five most popular activities were:

- swimming (13%);
- keep fit/yoga (12%);
- golf (5%);
- skiing/snowboarding (5%); and
- horse riding (5%). **Table 21**

There were some differences between the sexes. Women were more likely to want to participate in swimming, keep fit/yoga and horse riding whereas golf was more popular among men (table not shown).

Notes and references

- 1 All references to 'sports' include sports, games and physical activities unless otherwise stated.
- 2 Cue sports refers to snooker, pool and billiards.
- 3 In 2002 some of the sports questions changed, in particular for walking (see Appendix B for further details). Some of the change in participation rates for walking between 1996 and 2002 may be due to the different ways respondents were asked about this activity in the two survey years.
- 4 The new National Statistics Socio-economic Classification (NS-SEC) was introduced across all official statistics and surveys in 2001. It replaced Social Class based on occupation and Socio-economic Groups. For more information see Walker A et al. *Living in Britain: Results from the 2001 General Household Survey: Appendix E*. The Stationery Office (London 2003), also available on the web: www.statistics.gov.uk/lib.
- 5 The age-standardised ratios were calculated by dividing the observed rate of participation by the expected rate and then multiplying by 100. The expected rates used the 'indirect' method of age-standardisation that involved using age-specific participation rates. An age-standardised ratio of more than 100 indicates a greater likelihood of having participated in at least one physical activity than would be expected in that group on the basis of its age distribution alone. Conversely, a ratio of less than 100 indicates that members of the sub-group were less likely than expected from the age composition of the group to have participated in at least one physical activity. For more information see Appendix B - Methodology.
- 6 Respondents are asked on the GHS whether they have a longstanding illness, disability or infirmity. Those who report a longstanding illness are then asked if this limits their activities in any way. It is left to the respondent to define what is meant by longstanding illness, disability or infirmity. For more details see Rickards L et al. *Living in Britain: Results from the 2002 General Household Survey: Chapter 7: General health and use of health services*. The Stationery Office (London 2004), also available on the web: www.statistics.gov.uk/lib2002.
- 7 This could have been either the respondent's home or someone else's.
- 8 A mistake was found with the corresponding published data in 1996, Table 13.15. The correct percentages are 6% of all adults, 7% of men and 5% of women used a facility that belonged to a school, college or university.

Chapter 4 Participation in leisure activities

Questions about participation in leisure activities have been included in the sports and leisure section of the General Household Survey (GHS) since 1977 but were reduced in 1990 to questions about participation in selected leisure activities in the four weeks before interview. In 2002, some of these selected leisure activities were removed and others added to reflect changes in society. Two new questions were also included which asked about volunteering in a cultural/arts event or organisation.

In 2002 on the GHS, data were collected about adults' participation in selected leisure activities. It was reported in the survey, in the four weeks before interview, that:

- 99% watched TV;
- 88% listened to the radio;
- 83% listened to records/tapes;
- 65% read books;
- 11% sang or played a musical instrument either to an audience, or to rehearse for an event or for their own pleasure;
- 11% danced (excluding fitness classes and aerobics);
- 9% painted or did drawing, printmaking or sculpture;
- 4% wrote stories, plays or poetry;
- 3% helped with the running of an arts/cultural event or organisation on a voluntary basis (without pay except for expenses); and
- 2% performed in a play, drama or rehearsed for a performance.

In addition to the provision of information about selected leisure activities, information from these questions also provides a benchmark against which to measure the popularity of sports, games and physical activities. Participation in certain leisure activities was much higher than in sports, games and physical activities. **Table 22**

Leisure activities by age and sex

- Women were significantly more likely to have read books than men (72% compared with 58%) but there was little variation with age.
- In general, the proportion of adults who listened to the radio or records/tapes decreased with age.
- Men and women in the youngest age group (16 to 19) were the most likely to have performed in a play, done painting or writing. Participation rates for performing in plays and painting also decreased with age.
- Among women, those in the youngest age group (16 to 19) were also the most likely to have listened to records/tapes (99%) and sang/played a musical instrument (24%).
- Women were nearly twice as likely as men to have been dancing (14% compared with 8%). The peak ages for dancing were 16-19 for women (33%) and 20 to 24 for men (15%).

Table 22 and Figure F

Trends in leisure participation

In the four weeks before interview:

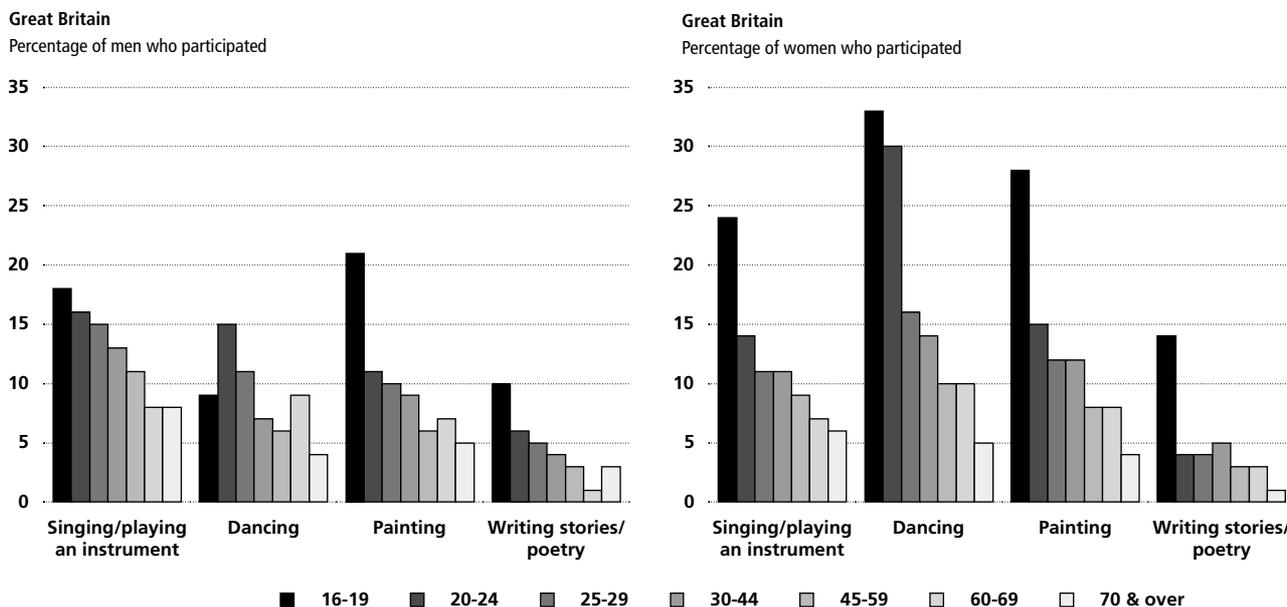

- as in 1996, almost all respondents had watched television (99%) and a high proportion had listened to the radio (88%) in 2002;
- the proportion of adults who said they listened to records or tapes increased steadily from 62% in 1977 to 83% in 2002; and,
- between 1996 and 2002 there was no change in the proportion of adults who had read books during the four-week reference period (65%).

Table 23

Leisure participation rates by socio-economic classification

Participation rates in selected leisure activities in the four-week reference period varied by socio-economic status.

Figure F Proportion of men and women who participated in selected leisure activities in the four weeks before interview by age: 2002

Adults whose household reference person (HRP) was in the large employers and higher managerial group were significantly more likely than those whose HRP was in the routine group to have participated in any of the leisure activities covered, except watching TV and performing in a play. For example:

- 81% of adults whose HRP was in the large employers and higher managerial group had read books in the four weeks before interview compared with 52% of adults whose HRP was in the routine group.

When participation in selected leisure activities was analysed by NS-SEC and sex, levels of participation in most leisure activities were higher among men and women whose HRP was in the large employers and higher managerial group than those whose HRP was in the routine group. However, this trend was more marked for men than women.

Across the socio-economic spectrum, a higher proportion of women than men had read books in the previous four weeks but there was no significant difference between men and women who had never worked or were long-term unemployed.

Table 24

Leisure participation rates by region

The only significant regional difference in participation in selected leisure activities was that the proportion of adults living in England who said they listened to the radio was

higher than the proportion in Wales and Scotland (88% compared with 86% and 84% respectively).

Table 25

Leisure participation rates by health status

Among adults who reported that they were suffering from a limiting longstanding illness or disability, 23% said they had participated in a specialised leisure activity (the arts)¹ compared with 28% of adults who did not have a limiting longstanding illness. People with a limiting longstanding illness had lower participation rates in listening to the radio, playing records/tapes, reading books, singing/playing a musical instrument, going dancing, and performing in a play than those without. This could reflect age differences² of the groups and also mobility problems in the case of dancing. There were no significant differences between participation levels in watching TV, painting and writing stories/plays by whether people had a limiting longstanding illness or not.

Table 26

Leisure participation rates by ethnicity

The age structure of different ethnic groups varied. The mixed race group had the youngest age structure of all the ethnic groups and the White British population had the oldest³. Table 27 shows the relationship between participation in specialised leisure activities (the arts) and ethnicity⁴ standardised for age. Pakistani/Bangladeshi, Other Asian Background and Indian people were less likely than

expected, after controlling for age, to have participated in at least one of the arts (ratios of 52, 57 and 62 respectively).

Table 27

Attendance at leisure and recreation classes

In 2002, questions about attendance at leisure and recreation classes were addressed to people aged 16 to 69 and referred to attendance during a four-week reference period. In 2002, 7% of adults aged 16 to 69 had attended a leisure or recreation class⁵ in the four weeks before interview.

- Women were more than twice as likely as men to have attended a leisure or recreation class (10% compared with 4% respectively). This difference between men and women was most apparent among those aged 35 or over.

Table 28

Attendance at leisure and recreation classes varied with economic activity status, socio-economic group and educational qualifications.

- Adults in part-time work were more likely to have attended leisure or recreation classes than those in full-time work or those who were unemployed (9% compared with 6% and 4%).
- Among adults who were economically inactive, 8% had attended classes. The pattern for women to be more likely than men to attend leisure or recreation classes was independent of economic activity status.
- The proportion who had attended a leisure or recreation class ranged from 10% of those living in households headed by someone in the managerial and professional group to 4% of those living in households headed by someone in the routine and manual group.
- Among people aged 16 to 69, those with a degree or equivalent qualification were nearly three times more likely to have attended a leisure or recreational class than those with no qualifications (11% compared with 4%).

Table 29

Table 30

In 2002, among those attending leisure or recreation classes, 23% said they were organised by a Local Education Authority⁶, 8% by a College of Further Education/Technical College, 4% by a University Extra-Mural department and 66% said some other kind of organisation. Over a quarter of female attendees (26%) said their class was organised by

a Local Education Authority, compared with 16% of male attendees.

Table 31

Notes and references

- 1 Specialised leisure activities (the arts) refer to singing or playing a musical instrument, dancing, painting, writing stories or poetry, or performing in a play.
- 2 Previous analyses of GHS data have shown that the likelihood of reporting a limiting longstanding illness increases with age. Therefore differences in participation rates between people who reported that they had a limiting longstanding illness or disability and people who did not may in part reflect the different age profile of the two groups.
- 3 For more information, see Rickards L et al. *Living in Britain: Results from the 2002 General Household Survey: Chapter 3: Households, families and people*. The Stationery Office (London 2004), also available on the web: www.statistics.gov.uk/lib2002.
- 4 Ethnicity is self-reported and respondents chose their answer from a list of options on a showcard.
- 5 'Leisure and recreation classes' includes any course or class which does not lead to an examination or qualification i.e. they are courses which are not designed to further people's career or job prospects. Interviewers were instructed that classes must be regular and have a teacher, instructor or supervisor.
- 6 This includes evening institutes or Centres of Adult Education.

Chapter 5 Sports and arts participation

Participation in sports and the arts

Participation in a sport, game or physical activity and in the arts¹ are usually reported separately. This chapter looks at the two together to explore the degree of overlap.

Over two thirds (67%) of all adults had participated in either a sport, game or physical activity (including walking) or the arts, in the four weeks before interview. Walking significantly contributed to adult participation in sports. Excluding respondents who had only been walking decreased the proportion of those who had participated in either sports or the arts from 67% to 55%. People were more likely to have participated in sports (including or excluding walking) than to have participated in both sports and the arts, or the arts alone. In the four weeks before interview (excluding walking):

- 28% of adults had participated in sports only;
- 15% of adults had participated in sports and the arts;
- 12% of adults had participated in the arts only; and
- the remainder (45%) had not participated in either sports or the arts.

Table 32

Volunteering in sports and the arts

For the first time in 2002, all adults were asked whether they had spent any time helping to organise sports or the running of an arts/cultural event or organisation on a voluntary basis. Among all adults, 4% said they had volunteered in sports and 3% said they had volunteered in the arts in the four weeks before interview. Less than 0.5% of adults (42 respondents) said they had volunteered in both sports and the arts (table not shown).

- Twice as many men as women had volunteered in sports (6% compared with 3%). This difference was also significant across each age band, except the youngest and oldest.

- As with participation, volunteering in sports tended to decrease with age, from 6% among adults aged 16 to 19 to 1% among those aged 70 and over. There was no clear association between age and volunteering in the arts.
- 60% of adults who volunteered in the arts did so for five or more hours during the four weeks before interview; the corresponding proportion among those volunteering in sports was 45%.
- There were no statistically significant regional differences in the extent to which people volunteered in sport or the arts.

Tables 33-35

Note

1. The arts are specialised leisure activities and refer to singing or playing a musical instrument, dancing, painting, writing stories or poetry, or performing in a play.

Notes to tables

1. The following conventions have been used within tables:

- .. data not available
- category not applicable
- 0 less than 0.5% or no observations
- [] the numbers in square brackets are percentages on a base of 20-49. See note 2.

2. Very small bases have been avoided wherever possible because of the relatively high sampling errors that attach to small numbers. In general, percentage distributions are shown if the base is 50 or more. Where the base is 20-49, the percentages are shown in square brackets.

3. A percentage may be quoted in the text for a single category that is identifiable in the tables only by summing two or more component percentages. In order to avoid rounding errors, the percentage has been recalculated for the single category and therefore may differ by one percentage point from the sum of the percentages derived from the tables.

The row or column percentages may add to 99% or 101% because of rounding.

4. A few respondents failed to answer some questions. These 'no answers' have been excluded from the analysis, and it follows that the base numbers for tables that describe the same population may vary.

5. Unless otherwise stated, changes and differences mentioned in the text have been found to be statistically significant at the 95% confidence level.

6. All percentages and means presented in the tables are based on data weighted to compensate for differential nonresponse. Both the weighted bases and the unweighted sample are given. The unweighted sample represents the number of people interviewed in the specified group. The weighted base gives a grossed up population estimate in thousands. Trend tables show unweighted and weighted figures for 2002 to give an indication of the effect of the weighting. For the weighted data the weighted base (000's) is the base for percentages. Unweighted data (up to 1996) are based on the unweighted sample. It should be noted that missing answers are excluded from the tables and this is reflected in the weighted bases, i.e. these numbers may vary between tables. For this reason, the bases themselves are not recommended as a source for population estimates. Recommended data sources for population estimates for most socio-demographic groups are: ONS mid-year estimates, the Labour Force Survey, or Housing Statistics from the Office of the Deputy Prime Minister.

* From April 2001 the National Statistics Socio-economic Classification (NS-SEC) was introduced for all official statistics and surveys. It replaced Social Class based on Occupation and Socio-economic Groups (SEG). Persons whose household reference person was a full-time student or had an inadequately described occupation are not shown as separate categories but are included in the figure for all persons.

* For details of qualification levels see Appendix A of Living in Britain 2002 main report.

† Total includes no answers to qualification level.

Table 31 Persons attending leisure and recreation classes in the 4 weeks before interview: type of college or organisation running classes by sex of participants

Persons aged 16-69* attending leisure classes

Great Britain: 2002

Type of college/organisation running classes†	Men	Women	Total
	%	%	%
Local education authority**	16	26	23
College of further education††	10	7	8
University Extra-Mural department	3	5	4
Other	71	64	66
<i>Weighted base (000's) = 100%</i>	<i>759</i>	<i>1,835</i>	<i>2,594</i>
<i>Unweighted sample</i>	<i>257</i>	<i>663</i>	<i>920</i>

* Questions about leisure classes were asked of people aged 16 and over up to 1996, but of 16-69 year olds in 2002. Up to 1996, respondents were also able to specify 'other' kind of college or organisation and then the answers were re-coded where appropriate during editing but this practice was dropped in 2002.

† Percentages may sum to more than 100, as people can attend more than one class.

** Including Evening Institutes and Centres of Adult Education.

†† Including technical colleges.

Appendix A Background information

Background information

The General Household Survey (GHS) is a multi-purpose continuous survey carried out by the Office for National Statistics (ONS). It collects information on a range of topics from people living in private households in Great Britain. The survey started in 1971 and has been carried out continuously since then, except for breaks to review it in 1997/1998 and to redevelop it in 1999/2000.

Since April 2000, the survey has consisted of two elements: the Continuous Survey and trailers. The Continuous Survey is to remain unchanged for the five-year period April 2000-March 2005, apart from essential changes that take into account, for example, changes in benefits and pensions. It consists of a household questionnaire, to be answered by the household reference person or spouse, and an individual questionnaire to be completed by all adults aged 16 and over who are resident in the household. The household questionnaire covers the following topics:

- demographic information about household members;
- household and family information;
- household accommodation;
- housing tenure;
- access to and ownership of consumer durables - including vehicles; and
- migration.

The individual questionnaire includes sections on:

- employment;
- pensions;
- education;
- health and use of health services;
- smoking;
- drinking in the last seven days;
- family information including marriage, cohabitation and fertility history; and
- income.

The modular structure of the GHS allows for a number of trailers to be included each year to a plan agreed by its sponsors. The trailers included in the 2002/2003 survey were:

- hearing;
- contraception; and
- sport and leisure.

Questions on sport and leisure were previously included in the 1987, 1990, 1993 and 1996 surveys. The module asks all respondents aged 16 and over about their participation in sports, games or physical activities and selected leisure activities. Proxy interviews were not taken for these questions.

In 2000 the survey introduced a dual weighting and grossing scheme. First, weighting to compensate for nonresponse in the sample based on known under-coverage in the Census-linked study of nonresponse. Second, the sample, which has been weighted for nonresponse, has been grossed

up to match known population distributions (as used in the *Labour Force Survey*). A full description can be found in Appendix D of the main 2002 *Living in Britain* report (see www.statistics.gov.uk/lib2002/downloads/appendices.pdf).

Fieldwork for the GHS is conducted on a financial year basis, with interviewing taking place continuously throughout the year. A sample of approximately 13,000 addresses is selected each year from the Postcode Address File. For 2002/2003 the survey response rate was 69%, with an achieved sample size of 8620 households and 20,149 people of all ages.

Since the 1994 survey, interviews have been conducted using computer-assisted personal interviewing (CAPI) on laptop computers, with the addition from 2000 of telephone interviews (CATI) with those people for whom proxy data had been collected for the core questions. The software is BLAISE.

Unpublished GHS data can be made available to researchers, for a charge, if resources are available, and provided that confidentiality of respondents is preserved. Any work based on the GHS data is the responsibility of the individuals concerned, but ONS should be given the opportunity to comment in advance on any report or paper using GHS data, whether prepared for publication or for a lecture, conference or seminar. In addition, copies of GHS datasets are available for specific research projects, subject to similar conditions, through the Data Archive at the University of Essex.

Appendix B Methodology

Introduction

Between 1987 and 1996, questions about participation in sport and leisure activities have been asked at three yearly intervals of adults aged 16 and over. The format of these questions has remained relatively unchanged but new questions were added in 1996 and 2002. In 2002 respondents were asked for the first time on the GHS about volunteering in sports and the arts, and the length of time spent volunteering in both types of activity in the last four weeks. Respondents were also asked whether there were any sports or leisure activities that they would like to do but were not doing at present. In addition, some of the questions about leisure activities previously asked in 1996 were replaced by questions about participation in cultural or arts activities, such as singing or playing musical instruments, acting, painting, dancing and writing. Previously, there had been a separate question about walking in the past twelve months but in 2002 it was included as part of a list of sports, games and physical activities. The order of some of the questions also changed in 2002. The change to the order and context of some questions, particularly walking, may have had an effect on the results.

Definition of sports, games and physical activities

Details about participation in sports, games and physical activities are obtained from a list on a showcard, which can also be supplemented by the respondent. This list and the questionnaire can be found in Appendix C. Walking is only counted if people went for a walk of two miles or more at one stretch for recreational purposes. However, cycling was included irrespective of purpose.

Reference periods

Respondents were asked about their participation in sports, games and physical activities in relation to two reference periods.

Four-week participation rate: the percentage of people aged 16 and over who took part in an activity in the four weeks before interview.

Since interviewing continues throughout the year, the survey figures represent participation in a four-week period averaged over a year. A reference period of four weeks was adopted in 1973 as being short enough

for answers to be reasonably reliable but long enough to be representative of participation and to yield adequate numbers of participants in the main sporting activities.

Twelve-month participation rate: the percentage of people aged 16 and over who took part in an activity in the twelve months before interview.

A twelve-month reference period is useful in obtaining information about activities that occur infrequently. However, recall over such a period may be poor and there is also a risk of overstatement because some respondents may be reluctant to admit that they have not participated in any sports over such a long period. It is not possible from the questions on the survey to measure the extent of any such under- or over-reporting.

Twelve-month rates are likely to be higher than four-week rates because some of those who have participated during the year will not have done so during the four weeks before their interview. This is most likely to occur if the activity is seasonal or attracts infrequent participants.

Frequency of participation

The GHS asks participants about the number of days on which they took part in each activity over the four weeks before interview. In 2002, frequency was not asked for walking, darts and any physical activities not listed on the showcard. These data are used to calculate three measures of frequency of participation.

Average frequency of participation per participant in four weeks: the number of occasions of participation in a sport in the four weeks before interview averaged over the number of participants in that sport.

The number of occasions of participation is equivalent to the total number of days on which a respondent participated in each reported activity. In cases where respondents had participated in an activity more than once on the same day this is counted as a single occasion. This is to avoid difficulties in deciding what to count as separate occasions, for example where heats and finals have taken place on the same day. However, if a respondent has taken part in two different activities on the same day this will count as one occasion for each activity.

Participation four times in four weeks: the proportion of respondents who participated four or more times in a sport in the four weeks before interview.

This provides a measure of frequent (approximately once a week) sports participation.

Participation twelve times in four weeks: the proportion of respondents who participated twelve or more times in a sport in the four weeks before interview.

This measure provides an indicator of sports participation (which is approximately three times a week) that has positive benefits for physical fitness. It is used in the Framework for Sport in England strategy, which is aimed at increasing physical activity.

Age-standardisation

The strong association between participation in physical activity and age needs to be taken into account when investigating the possible relationship between participation and other characteristics of the sample.

This is achieved by calculating the level of participation that would be expected for different sub-groups in the sample taking into account the age profile of that sub-group alone ('indirect' method of age-standardisation)¹. This is then compared with the observed level of participation, which reflects the effects of both age and the nature of the sub-group. The age-standardised ratio is calculated by dividing the observed rate by the expected rate and multiplying by 100. A standardised ratio of more than 100 for a sub-group indicates that the observed level of participation is higher than would be expected on the basis of its age distribution alone. A ratio of less than 100 indicates that it is lower than would be expected on the basis of its age distribution alone.

It should be noted that the results of the age-standardisation should be interpreted with some caution. Firstly, age-standardised ratios reflect the average relationship across all age bands and so do not reflect the full complexity of relationships which may differ between different age groups. Therefore, the age-standardisation method cannot replace the level of detail provided in tables by age group. Secondly, the standardised ratios only

take account of age differences between the sub-groups specified in each table and do not make any adjustment for other characteristics which may help to explain the observed differences. Thirdly, the age-standardisation method does not take into account the rates observed for age bands within the sub-groups that are likely to be based on small sample totals and to be affected by substantial sampling error.

Note

- ¹ This is different from the age-standardised adjusted rate quoted in some texts which adjusts the population participation rate to the age distribution found in the subgroup.

Appendix C The questions and showcards

SPORT AND LEISURE

Introsp THE NEXT SECTION IS ABOUT SPORT AND LEISURE

1. Sprtyr1 Ask all (except proxy respondents)

On this card is a list of sports and physical activities. Please tell me if you took part in any of them in the last twelve months. Do not count any teaching, coaching or refereeing you may have done.

CODE 23 IF THE RESPONDENT HAS NOT PARTICIPATED IN ANY OF THESE SPORTS

Walking (recreational) or hiking 2 miles or more.....	1	→ Q2
Swimming or diving indoors	2	
Swimming or diving outdoors	3	
Cycling.....	4	
Indoor bowls	5	
Outdoor (lawn) bowls.....	6	
Tenpin bowling.....	7	
Keepfit, aerobics, yoga, dance exercise	8	
Martial Arts (INCLUDE SELF DEFENCE	9	
Weight training (INCLUDE BODY BUILDING)	10	
Weight lifting	11	
Gymnastics.....	12	
Snooker.....	13	
Darts.....	14	
Rugby union or league	15	→ Q2
American football.....	16	
Football indoors.....	17	
Football outdoors.....	18	
Gaelic sports	19	
Cricket	20	
Hockey.....	21	
Netball	22	
None of these.....	23	

2. Sprtyr2 And have you taken part in any of these sports and physical activities in the last twelve months? Again, do not count any teaching, coaching or refereeing you may have done.

CODE 23 IF THE RESPONDENT HAS NOT PARTICIPATED IN ANY OF THESE SPORTS

Tennis	1	→See Q3
Badminton	2	
Squash	3	
Basketball.....	4	
Table Tennis.....	5	
Track and field athletics	6	
Jogging, cross country, road running	7	
Angling, fishing	8	
Yachting or dinghy sailing	9	
Canoeing.....	10	
Windsurfing/board sailing	11	
Ice Skating.....	12	
Curling.....	13	

Golf, pitch and putt, putting	14	→See Q3
Skiing.....	15	
Horse riding.....	16	
Climbing, mountaineering.....	17	
Motor sports	18	
Shooting.....	19	
Volleyball.....	20	
Other	21	
None of these.....	22	
None at all	23	

3. MoWalks If Sprtyr1 = 1

Now thinking of the four weeks ending yesterday did you go for a walk of 2 miles or more during these four weeks?

Yes.....	1	→See Q4
No.....	2	

4. Othsprt If Sprtyr2 = 21

Please tell me what the other sport(s) or physical activity(s) is/are

ENTER TEXT OF AT MOST 100 CHARACTERS→ See Q5

5. Tuition Ask for each sport mentioned at SprtYr1 and SprtYr2 (except 'walking', 'darts' and 'other')

Over the **past twelve months** have you received tuition from an instructor or coach to improve your performance in (activity)?

Yes.....	1	→ Q6
No.....	2	
Not sure.....	3	

6. Comp Thinking about (activity) have you taken part in any **organised** competition in (activity) in the **last twelve months**?

Yes.....	1	→ Q7
No.....	2	

7. Sport4 Did you take part in (activity) in the past four weeks? Again, please do not count any teaching coaching or refereeing you may have done.

Yes.....	1	→ Q8
No.....	2	

8. Sprtime If Sport4 = 1

On how many days in the last four weeks have you played/gone(to) (activity).

1..28	→ Q9
-------------	------

9. Spwhere At which of these places on this card have you done/played (activity) in the last four weeks ?

INDIVIDUAL PROMPT
CODE ALL THAT APPLY

- Indoors at a facility which is **mainly** used for sport (e.g sports centre or gymnasium or indoor swimming pool or commercial leisure facility) 1] → Q10
- Indoors at some other location **not mainly used for sport** (such as a community centre, village hall or scout hut)..... 2]
- Indoors or outdoors at home or someone else's home..... 3 → See Q11
- Outdoors on a court, course, pitch or playing field (or outdoor swimming pool) 4 → Q10
- Outdoors in a natural setting (such as the countryside, rivers, lakes or seaside)..... 5]
- Other - including roads and pathways in towns and cities 6] → See Q11

10. SchICol If *Spwhere* = 1, 2 or 4

- Do any of these facilities belong to a school, college or university?
- Yes..... 1] → See Q11
- No..... 2]

11. SpClub Ask for each activity taken part in during the last 4 weeks (except 'walking', 'darts' and 'other')

- Over the **past four weeks** have you been a member of a club, particularly so that you can play/participate in (activity)?
- Yes..... 1 → Q12
- No..... 2 → Q13

12. ClubTyp If *SpClub* = 1

- What type of club was this?
- ENTER AT MOST 4 CODES
- Health/fitness..... 1]
- Social club (e.g employee clubs, youth clubs) 2] → Q13
- Sports club 3]
- Other 4]

13. Volunt Ask all

- Looking back over the last four weeks, have you spent any time helping to organise sport on a voluntary basis (that is, without pay except for expenses)? Please include any teaching, coaching or refereeing you may have done as a volunteer.
- Yes 1 → Q14
- No 2 → Q15

14. Voltime If *Volunt* = 1

- During the last four weeks, how many hours in total have you spent on voluntary sports work?
- Less than 1 hour..... 1]
- 1 hour less than 2 hours..... 2] → Q15
- 2 hours less than 5 hours 3]
- 5 hours or more 4]

15. Sprtnot Ask all

- Is there any sport or recreational activity that you do not do at the moment but would like to do?
- Yes..... 1] → Q16
- No..... 2] → Q17

16. Sprtwch If *Sprtnot* = 1

- Which one activity would you like to do?
- ENTER TEXT OF AT MOST 30 CHARACTERS → Q17

17. Entern All adults (except proxy respondents)

- Now thinking about **the four weeks ending yesterday**, could you tell me whether you have done any of these things in your leisure time or for entertainment?

- 18. TV** Watched TV?
- Yes..... 1] → Q19
- No..... 2]

- 19. Radio** Listened to the radio?
- Yes..... 1] → Q20
- No..... 2]

- 20. Records** Listened to records or tapes?
- Yes..... 1] → Q21
- No..... 2]

- 21. Books** Read books?
- Yes..... 1] → Q22
- No..... 2]

- 22. Music** Sung, or played a musical instrument to an audience, or rehearsed for an event, or played a musical instrument for your own pleasure?
- Yes..... 1] → Q23
- No..... 2]

- 23. Acting** Performed in a play or drama, or rehearsed for a performance?
- Yes..... 1] → Q24
- No..... 2]

- 24. Paint** Done any painting, drawing, printmaking or sculpture?
- Yes..... 1] → Q25
- No..... 2]

25. Dance Done any dance (excluding fitness classes and aerobics)?

Yes..... 1] → Q26
 No..... 2]

26. Writing Written any stories, plays or poetry?

Yes..... 1] → Q27
 No..... 2]

27. Volcult Looking back over the last four weeks, have you spent any time helping with the running of an arts/cultural event or arts organisation on a voluntary basis (that is without pay except for expenses)?

Yes..... 1 → Q28
 No..... 2 → End of Interview

28. Voltime2 If *Volcult* = 1

During the last four weeks, how many hours have you spent on voluntary arts / cultural work in total?

Less than 1 hour..... 1
 1 hour less than 2 hours..... 2
 2 hours less than 5 hours..... 3
 5 hours or more..... 4

END OF INTERVIEW

Showcards**Q1**

- 1 Walking (recreational) or hiking for 2 miles or more
- 2 Swimming or diving indoors
- 3 Swimming or diving outdoors
- 4 Cycling
- 5 Indoor bowls
- 6 Outdoor (lawn) bowls
- 7 Tenpin bowling
- 8 Keepfit, aerobics, yoga, dance exercise (include exercise bike)
- 9 Martial Arts (include self defence)
- 10 Weight training (include body building)
- 11 Weightlifting
- 12 Gymnastics
- 13 Snooker, pool, billiards (exclude bar billiards)
- 14 Darts
- 15 Rugby Union or league
- 16 American football
- 17 Football indoors (include 5-a-side)
- 18 Football outdoors (include 5-a-side)
- 19 Gaelic sports (eg camogie, Gaelic football, hurling, Irish handball and shinty)
- 20 Cricket
- 21 Hockey (exclude ice, roller and street hockey, but include in 'other')

Q2

- 1 Tennis
- 2 Badminton
- 3 Squash
- 4 Basketball
- 5 Table tennis
- 6 Track and field athletics
- 7 Jogging, cross-country, road running
- 8 Angling or fishing
- 9 Yachting or dinghy sailing
- 10 Canoeing
- 11 Windsurfing or boardsailing
- 12 Ice skating
- 13 Curling
- 14 Golf, pitch and putt, putting
- 15 Skiing (on snow or an artificial surface; on slopes or grass)
- 16 Horse riding
- 17 Climbing/mountaineering (including indoor climbing)
- 18 Motor sports
- 19 Shooting
- 20 Volleyball
- 21 Other
